

Paleoclimate Simulations with CAM, SPCAM and CESM

Mark Branson, Eli Tziperman, Dave Randall, Dorian
Abbot and Matt Huber
CMMAP Summer 2011 Team Meeting

Goals

- Study Arctic cloud convective feedback mechanism with SPCAM
 1. Identify the minimum CO₂ concentration which leads to the melting of winter sea ice and to the activation of the convective cloud feedback
 2. Identify the transient vs equilibrated response of the feedback during a transient simulation of increased CO₂ concentration.

Goals (cont.)

3. Study the response of the SPCAM over the arctic and continental interiors to increased CO₂ concentration under Eocene boundary conditions (Purdue simulations)

Completed Work

Standard CAM + slab ocean model followed by SPCAM + slab ocean model for:

- 16xPI CO₂ concentration (~4480ppm)
- 4xPI CO₂ concentration (start from prior CCSM experiment)

Slab Ocean Model (SOM)

1. Run model with fixed SSTs for a reasonable amount of time and compute Q-fluxes.
2. Also compute mixed-layer depth (in these simulations a constant mixed-layer depth of 50m was used for the entire globe)
3. Use the Q-fluxes to drive the SOM.

must do this separately for CAM and SPCAM!

Compute monthly mean net flux into the ocean from the control simulation:

$$F = FS - FL - LH - SH$$

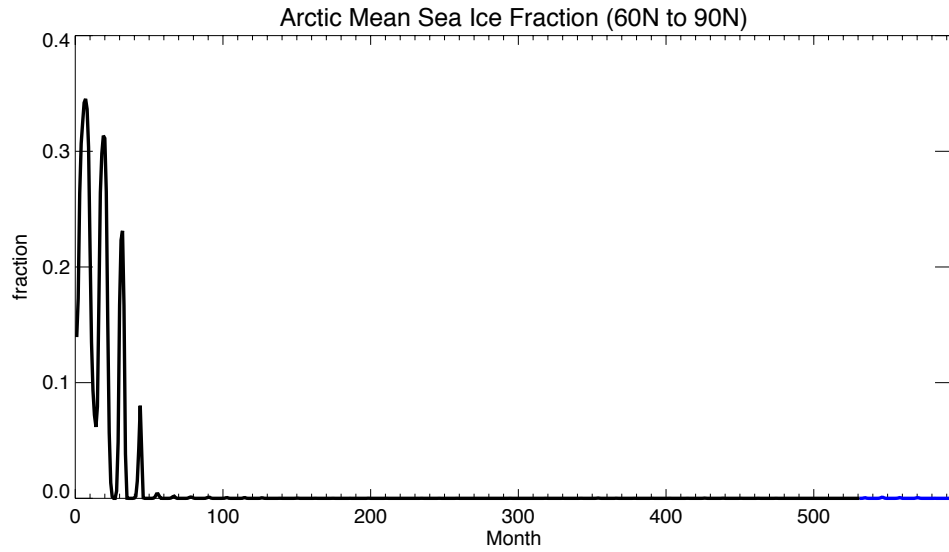

where FS = net shortwave flux

FL = net longwave flux

LH = latent heat flux

SH = sensible heat flux

I6xPI CO2

— Standard CAM — SPCAM

— Standard CAM — SPCAM

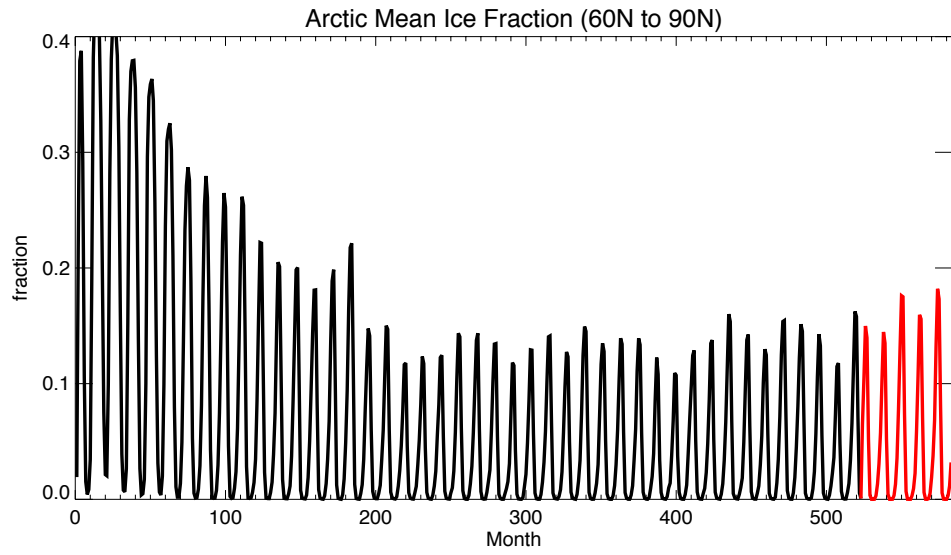

— Standard CAM — SPCAM

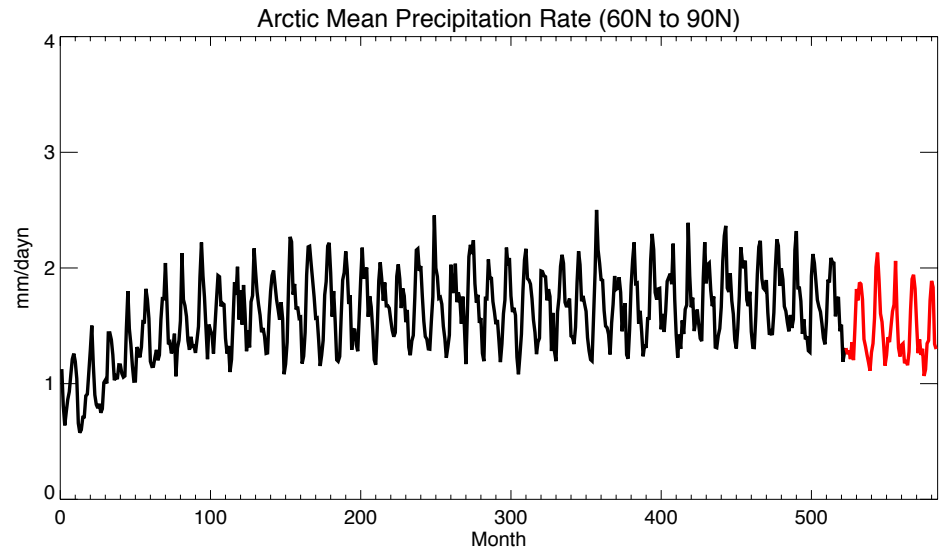

— Standard CAM — SPCAM

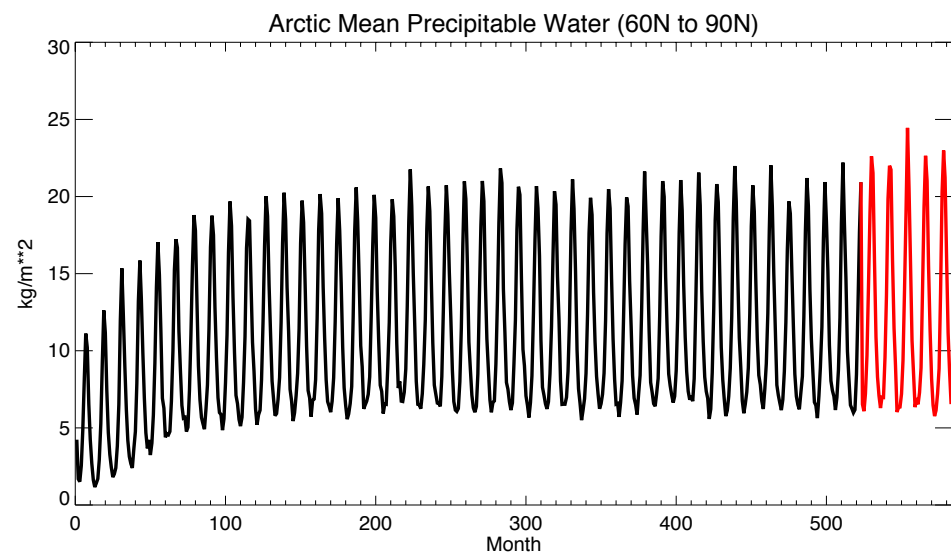

4xPI CO2

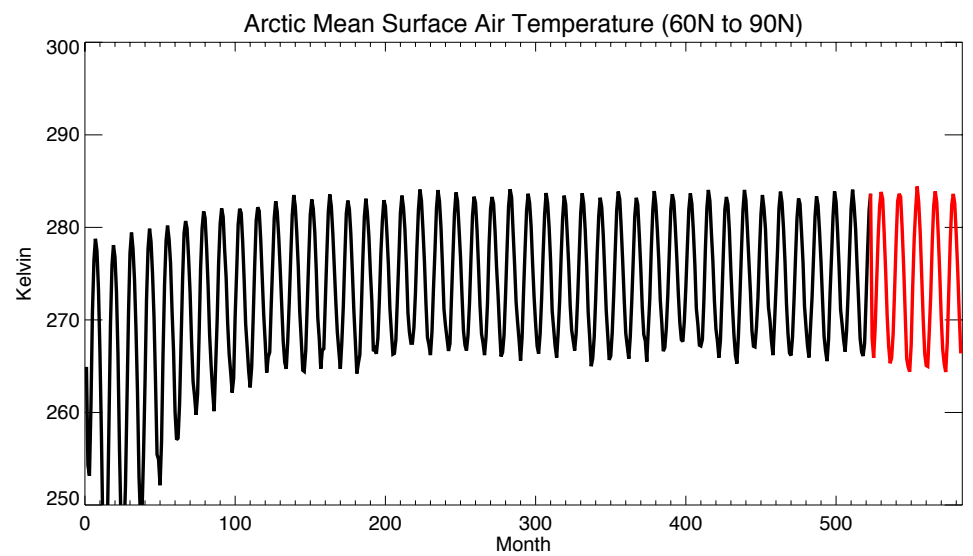

— Standard CAM — SPCAM + SPQFLUX

— Standard CAM — SPCAM + SPQFLUX

— Standard CAM — SPCAM + SPQFLUX

— Standard CAM — SPCAM + SPQFLUX

SPCAM Total Cloud Forcing at CO₂=4480ppm (W/m²)

SPCAM Total Cloud Forcing at CO₂=1120ppm (W/m²)

Ongoing Work

Fully-coupled CESM simulation: **B_1850_2000_CN**

- 1850 to 2000 transient
- “CN” = active carbon-nitrogen model in CLM
- using CAM4 physics
- “f19_g16” grid setup: finite volume 2deg grid for atmos, 1deg displaced-pole ocean grid

Ongoing Work

step 1: spinup: 25 years starting from 1850 but holding all trace gases constant.

step 2: 1% per year increase CO₂ ==> 3xPI

step 3: run two SPCAM simulations initialized from this run at:

- when Arctic sea ice has decreased by 50%
- at end of this fully-coupled simulation

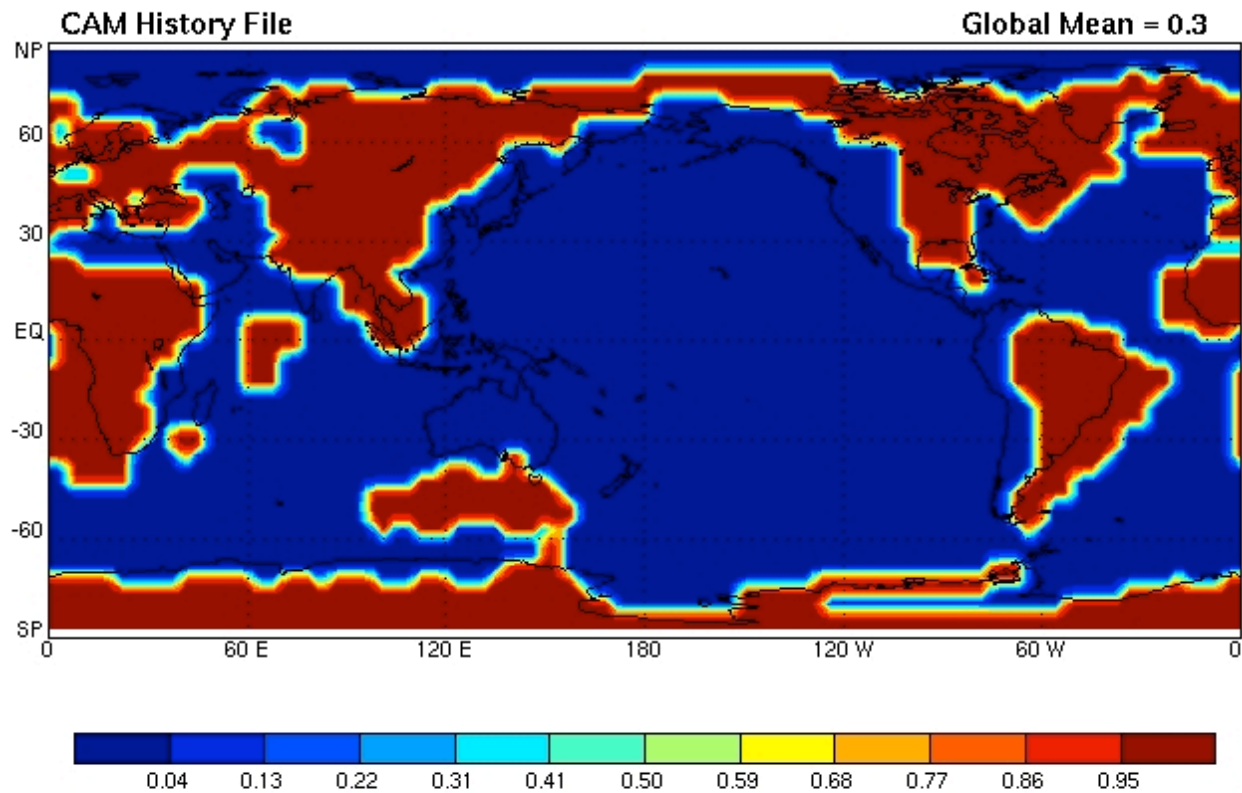

CESM is a whole different animal than CCSM3.

- **Good: canned cases, optimized for many popular supercomputers (bluefire, franklin, etc.)**
- **More steps, tougher to tweak the details**

Eocene Land Fraction

Fraction of sfc area covered by land [LANDFRAC]

fraction
