Superparameterized CESM (SP-CESM)

From this

Multiple atmospheres,
single land

To this

Multiple atmospheres,
multiple land

Multi-Instance Functionality in the CESM

- **CESM1.1** includes new capability to run multiple component instances under one model executable
- **Caveat:** if N multiple instances of any one active component is used then N multiple instances of **ALL** active components are required
- Primary motivation: Ability to run an **ensemble** kalman filter for data assimilation and parameter estimation.
- Also provides ability to run a set of experiments within a single CESM executable (each instance can have a different namelist)

Multiple Component Instances in the SPCESM

- Extend multi-instance capability to couple each cloud-resolving model (CRM) column with a unique land grid cell
- **Trick in env_mach_pes.xml:** Set `NINST_ATM=NINST_LND` (= # of CRMS) but set `NINST_ATM_LAYOUT` to “sequential” instead of “concurrent”
- One instance of CAM running, but the coupler will think there are as many instances as cloud columns per grid cell

Software Engineering

- Add **inst_index** component to coupler variables: sensible and latent heat fluxes, albedos, surface upward longwave flux, etc.
- `cam_in%shf(ncols)` becomes `cam_in%shf(ncols,inst_index)` in coupler code
- `cam_in%shf(ncols)` becomes `cam_in%shf(ncols,crm_nx)` in CAM code
- Do this **everywhere** they are found!!!

Software Engineering (2)

- Pass CRM-level variables through coupler to CLM:
 - Lowest layer: T, U, V, q, z, rho, theta
 - Rain and snow
 - Radiation: surface downward LW, sfc net SW, etc.
- **Turn the CRM-level v winds back on!**

Software Engineering (3)

- Get single column version working (SCAM)
 - regular SCAM **works**
 - non-multi-instance SP-SCAM **works**
 - multi-instance SP-SCAM **not quite working**

Multi-instance SP-SCAM

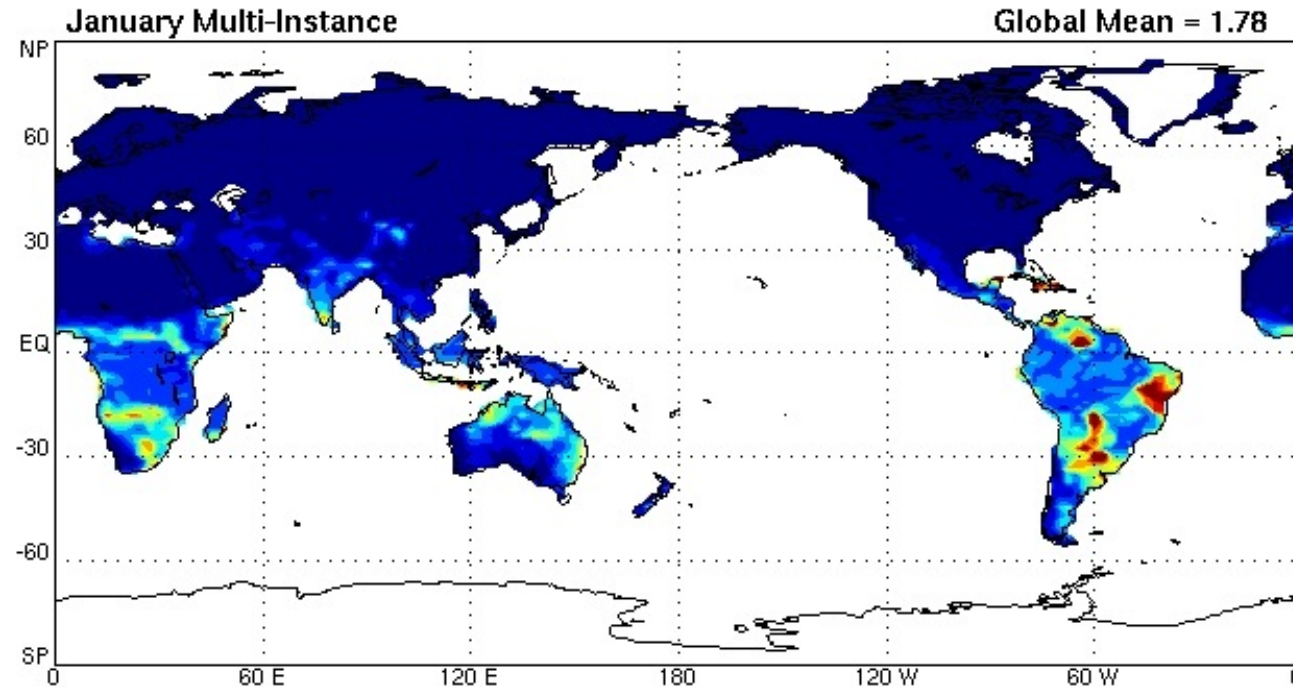

- Challenge: SCAM is compiled as a serial job
- But we need to run it as parallel job to use the multi-instance functionality
- Although it's overkill, there's no reason that SCAM can't be run as a parallel job
- Problem: Parallel decomposition is normally dependent on the grid size, but for SCAM we have $plat=1$

Going Forward

- Explore spatial heterogeneity within the CRM framework
- Incorporate tracer (CO₂, OCS, isotopes?) fluxes
- Run a fully-coupled simulation: How to handle enormous ocean history files for all instances
